Statement of Delivery

Some changes were made to the website due to technical difficulties. The following changes were made:

- Different navigational icons – the original icons were made using Microsoft Word and was therefore quite difficult to implement onto the website. The new navigational system has the same layout with the same colours and font but it does not have the same style was the one proposed in the design document.

- Some icons such as the Submit and RSVP buttons were also removed for the same reason as above. They have been replaced with regular hyperlinks.

- The news section of the homepage has been changed to display the headings of the news items instead of the monthly archive. This is a more logical layout as Bunch of Hackz will not have too many news items to display. This will help improve the user experience by improving the navigational system.

- The upcoming events page was changed into an events calendar page. It is redundant to repeat the same link twice. A calendar was added so that members of Bunch of Hackz can easily view any upcoming events as well as add the calendar to their electronic devices.

The JavaScript elements added to the website were mainly for form validation. This helps to reduce the possibility of bot spam as well as ensuring a contact method with the commenter. This helps to improve communication between the organization and the community. Also, warnings will appear if the user has entered an invalid input into any of the forms. This will help to improve user experience as users will know what element of the form to edit before submitting. Another JavaScript element that was added to the website was hiding the comments section in the Events pages as well as the Past Projects pages. Users will be able to reveal the "Leave a Comment" form by clicking on the comment button. This helps to reduce clutter on the page and improve the aesthetics of the website. This will consequently improve the overall user experience. An automatic picture slider was also added to each page apart from the Projects page. This slider is responsible for showcasing the different aspects of Bunch of Hackz and their community. The projects page contains a gallery of all the different projects Bunch of Hackz has been responsible for. This is the best way to showcase the past projects from Bunch of Hackz to new users.
